Glossary  60
The Venue Theatre is a fully modular 8 bus mixer providing unique versatility for sound effects and live mixing, whether it's in a theatre, concert hall or conference auditorium.

The console is based on a theatre input module specifically tailored to the requirements of theatre sound, providing comprehensive routing facilities on illuminated switches, individual channel metering and four master mute groups. Consoles may be specified with theatre modules for all inputs, or frames may be filled with any combination of modules from the Venue range, enabling you to design a console that fits your exact needs.

The console provides full 8 bus routing and six independent auxiliary sends, and four mute groups which allow the status of each input channel to be controlled by four master mute busses for rapid resetting of the console during a live performance.

The Stereo Input includes a further innovation - a Stereo Width control, enabling the width of a stereo image to be continuously varied. This is a unique feature on a console of this type, and is ideal for enhancing theatre sound effects.

Venue Theatre comprises a range of input module, output module and frame options that lets you configure the console for a wide variety of applications, and to alter the layout very easily if required. The only constraint on the selection and positioning of modules is that any console must have a master module (2 channels width) fitted, and that any group output modules fitted have to be positioned immediately to the left of this.

Should you wish to replace or add extra modules, please contact your authorised Soundcraft dealer, who can supply the modules and change the configuration without voiding the warranty.

The output section of the Venue Theatre has been carefully designed to offer the maximum number of independent outputs in a compact mixer. The Dual Matrix module provides superb versatility for theatre applications, allowing additional output mixes to be created from signals present at the group and mix outputs, or from external submixers. A full 8 x 8 matrix is created by using only four modules, although any number can be specified.

The Dual Group/EQ module packs two independently controlled output groups into one module, each with a 3 band mid sweep EQ section. For even greater flexibility the Dual Group/Stereo Return module (which is fitted as standard) contains all the features required for generating subgroups and stereo effects returns, and the stereo return section is ideal for bringing in additional stereo sources without taking up valuable input modules.

The Venue Theatre is supplied in three frame sizes - 24, 32, 40 or 44 channels. A removable overbridge is available as an option, and may be fitted with either moving coil VU or PPM meters.
Precautions and safety instructions

General Precautions
Avoid storing or using the mixing console in conditions of excessive heat or cold, or in positions where it is likely to be subject to vibration, dust or moisture. Do not use any liquids to clean the fascia of the unit: a soft dry brush is ideal. Use only water or ethyl alcohol to clean the trim and scribble strips. Other solvents may cause damage to paint or plastic parts.

Avoid using the console close to strong sources of electromagnetic radiation (e.g. video monitors, high power electric cabling): this may cause degradation of the audio quality due to induced voltages in connecting leads and chassis. For the same reason, always site the console power supply away from the unit.

Caution! In all cases, refer servicing to qualified personnel.

Handling and transport
The console is supplied in a rugged cardboard box. If it is necessary to move it any distance after installation it is recommended that this packing is used to protect it. Be sure to disconnect all cabling before moving. If the console is to be regularly moved (e.g. for touring) we recommend that it is installed in a foam lined flight case. At all times avoid applying excessive force to any knobs, switches or connectors.

Power supplies and cabling
Always make sure that the power supply has been set to the same source voltage as the mains supply.

Always use the power supply and power cable supplied with the mixer: the use of alternative supplies may cause damage and voids the warranty; the extension of power cables may result in malfunction of the mixing console.

Warning! Always switch the power supply off before connecting or disconnecting the console power cable, removing or installing modules, and servicing. In the event of an electrical storm, or large mains voltage fluctuations, immediately switch off the PSU and unplug from the mains.

Always ensure that you use the correct type of power supply for the size of your console as shown below:

24 & 32 Channel Frames  CPS650 or CPS650B
40 & 44 Channel Frames  CPS750 or CPS750B
The standard Venue Theatre console uses two different types of audio connector, 3 pin XLR (top diagram) and ¼” three pole (‘A’ gauge or stereo) jacks. The latter are used in three different configurations, as shown below. The rear frame of the console has standard apertures fitted with blanking panels. Your Soundcraft dealer can supply a variety of mounting plates to fit these, with EDAC (ELCO) multiway connectors, together with looms to link them to the modules.

¼” ‘A’ Gauge Stereo Jack Plug used as balanced input: line inputs and tape returns

- Tip - HOT (IN PHASE SIGNAL)
- Ring - COLD (OUT OF PHASE SIGNAL)
- Sleeve - GROUND (SCREEN)

¼” ‘A’ Gauge Stereo Jack Plug used as ground compensated output: auxiliary send outputs and control room monitor outputs

- Tip - HOT (SIGNAL)
- Ring - GROUND SENSE
- Sleeve - GROUND (SCREEN)

¼” ‘A’ Gauge Stereo Jack Plug used as unbalanced output: direct outputs

- Tip - HOT
- Ring - GROUND (SCREEN)
- Sleeve - GROUND (SCREEN)

¼” ‘A’ Gauge Stereo Jack Plug used as insert send/return

- Tip - RETURN FROM EXTERNAL DEVICE
- Ring - SEND TO EXTERNAL DEVICE
- Sleeve - GROUND (SCREEN)
**Signal levels**

It is important to supply the correct input levels to the console, otherwise signal-to-noise ratio or distortion performance may be degraded; and in extreme cases damage to the internal circuitry may result. Likewise, on all balanced inputs avoid sources with large common mode DC, AC or RF voltages, as these will reduce the available signal range on the inputs. Note that 0dBu = 0.775V RMS.

The microphone input is designed for use with balanced low impedance (150 or 200 ohm) microphones.

**Caution!** DO NOT use unbalanced microphones or battery powered condenser microphones with the +48V phantom power switched on: degraded performance or damage to the microphone may result.

The sensitivity of the microphone input is variable from -2dBu to -70dBu (for +4dBu at the Stereo Mix outputs), and the maximum input level (balanced) is 20dB above the set sensitivity that is, with the gain control at minimum, the maximum input level is +18dBu. Although the microphone input can thus handle some line level signals, we don’t recommend this, since the source may be unduly loaded by the low (2kΩ) input impedance, or be damaged by the +48V phantom power.

The line input has a sensitivity variable between -20dBu and +10dBu, and can also handle a maximum input level up to 20dB above the set value. Note that the maximum input level for unbalanced inputs is 4 or 5dB less than that for balanced signals, so very high level unbalanced signals (e.g. loudspeaker outputs of power amplifiers) may cause distortion. The input impedance is approximately 20kΩ, and thus high impedance sources (e.g. electric guitars) may be loaded too heavily. Such sources are best fed through an external DI (Direct Inject) box to the microphone input.

The main outputs of the console (e.g. Stereo mix, group outputs, aux sends) have a nominal output level of +4dBu, and an impedance of 75ohms. The Stereo mix and Group outputs also have the facility to switch the operating level to -10dBV to allow easy interface to domestic and semi professional equipment. These outputs will deliver full level (+21dBu unbalanced, +27dBu balanced) into loads of greater than 600ohms. Secondary outputs, such as channel insert sends and channel direct outputs (all unbalanced) have a nominal output level of -2dBu and a slightly higher output impedance of 200ohms, and will only deliver the full output level of +21dBu into load impedances of greater than 5kΩ.
Installation

The Venue Theatre is designed to offer ruggedness and compactness for touring applications, and to meet the exacting standards of fixed installations.

The diversity of live sound applications around the world is a great challenge for the designers of a top quality console such as the Venue Theatre. While great care is taken during design to ensure that installations are as trouble-free as possible, the following guidelines should be noted:

- Avoid multiple earth connections, especially in a large sound reinforcement installation where power is distributed, and cable runs can be very long.
- Where possible ensure that all cable screens and other signal earths are connected to ground only at their source.
- Avoid installing the console close to thyristor dimmer racks or other heavy current electrical equipment.
- Keep audio cables separate from lighting and other power cables.
- Provide a separate mains power supply for audio equipment, and where possible install an independent earth for all audio and communications equipment.
- Always ensure that you use the correct type of power supply for the size of your console as shown below:

<table>
<thead>
<tr>
<th>Channel Frames</th>
<th>Power Supply</th>

</thead>
<tbody>
<tr>
<td>24 &amp; 32 Channel Frames</td>
<td>CPS650 or CPS650B</td>
</tr>
<tr>
<td>40 &amp; 44 Channel Frames</td>
<td>CPS750 or CPS750B</td>
</tr>
</tbody>
</table>

Console Illumination

There is provision for two low voltage lamps on all three frame sizes. The BNC type sockets provide +12V at 330mA, and will power 12V Hi-Intensity (HI) lamps, or similar.

The sockets are wired as follows:

<table>
<thead>
<tr>

</tbody>
</table>

Examples of use

The diagrams opposite and overleaf show typical applications of the Venue Theatre in small and large scale PA applications, and in a theatre installation. These examples are of course only an indication of the systems possible with the unique flexibility of the Venue Theatre, which may be easily reconfigured to ideally suit your particular requirements.
Theatre sound calls for the maximum flexibility from a console, and the wide choice of input and output options available on the Venue Theatre ideally suits the console to this role. The configuration below shows a 24 channel frame fitted with 4 stereo modules handling 2 track tape machines, and four dual matrix modules feeding effects speakers. Mono outputs from two other tape machines are fed to the line inputs of the first two Theatre input modules, taking advantage of the full routing flexibility of those modules for spot effects. Typically there would be many more speakers required, ideally on individual mixer outputs, and this console provides 8 matrix outputs in addition to the normal mix L&R, 8 groups and 6 auxiliaries. Note that additional outputs may be taken from the direct outputs of all Theatre input modules. A stereo cassette player feeds the external inputs of one of the matrix modules to provide the simplest possible source of house music. The output from an effects processor is fed back to the groups and mix via a stereo return module. Since the requirement for microphones is often limited in a theatre application, the stereo modules provide the maximum number of inputs in a compact console.
Public Address

Use as the front-of-house console in a sound reinforcement system. Microphones covering drums, guitars and vocals are fed to the mic inputs of Mono Input modules. Keyboard and other line level sources are fed to line inputs, and stereo modules could be fitted in these positions as an alternative. The Stereo mix is fed to the main speakers, with a stereo effects unit available via the mix inserts. A separate effects unit is accessed via Aux 1, and returned to the console on one of the Dual Group/Stereo Return modules. Other Aux outputs may be used for foldback or other outboard equipment.
The diagram below shows a typical configuration in a larger scale sound reinforcement application. The main speakers are fed from the stereo mix via a parametric equaliser, with an effects processor connected to the mix inserts. Aux 1 and 2 feed stage foldback, and the outputs from an additional submixer are brought into one of the Dual Group/Stereo Return modules. Four Matrix sections are provided to feed side fill speakers or a centre cluster. The console is fitted with optional EDAC multicore connectors, to connect quickly and conveniently to stage microphone boxes or split feeds from another console.

Theatre Input Module

Description

Specifications

and Operation
Theatre Input Module

Channel Input

2. **+48V** switch applies 48V phantom power to the microphone input.

3. **LINE** selects the line input to the channel.

4. **HI-PASS FILTER** inserts a 100Hz second order filter immediately after the input amplifier.

5. **Ø (PHASE)** reverses the phase of the selected input.

Frequency Response Curves of the Hi-Pass Filter

![Frequency Response Curves of the Hi-Pass Filter](image)

Equaliser

6. The **EQUALISER** is a 4-band semi-parametric. HF. +/- 15dB shelving at a fixed frequency of 12kHz. HI MID. +/- 15dB peaking between 0.6 - 10kHz. Q = 1.5. LO MID. +/- 15dB peaking between 0.15 - 2.5kHz. Q = 1.5. LF. +/- 15dB shelving at a fixed frequency of 60Hz, with 30Hz VLF rolloff. The cut/boost pots are centre detented, the centre position giving a flat response. **EQ** switches the equaliser into circuit.

Auxiliaries

7. Six **AUXILIARY SENDS** are provided:

**AUX SENDS 1 & 2** are normally sourced post-fade; The associated **PRE** sources them pre-fade instead. The pre-fade signal is jumper selectable post-mute (default) or pre-EQ.

**AUX SENDS 3 & 4** are normally sourced post-fade; The associated **PRE** sources them pre-fade instead. The pre-fade signal is jumper selectable post-mute (default) or pre-EQ.
Frequency Response Curves of the Equaliser

Auxiliaries (cont)

AUX SENDS 5 & 6 are normally sourced post-fade; The associated PRE sources them pre-fade instead. The pre-fade signal is jumper selectable post-mute (default) or pre-EQ.

Direct Output

The ground compensated DIRECT OUT is normally post-fade; DIR disconnects AUX 6 from the auxiliary bus, and uses it to control the level of the DIRECT OUT instead.

Routing

PAN determines the position of the signal within the stereo mix, or enables the channel signal to be routed to selected output groups. In the centre position there is a 4.5dB level drop. Pan left feeds the signal to odd numbered group busses, pan right to even group busses. Panning fully left or right sends the channel signal to only the left or right side respectively.

The illuminated PAN switch activates the PAN control. When the switch is released all group output routing switches are sourced pre-PAN.
10 MIX routes the panned, post-fade signal to the left and right mix busses.

11 Eight illuminated ROUTING SWITCHES give access individually to the eight group busses. When used with the PAN control the channel signal may be routed to selected output groups by panning fully right (even groups) or left (odd groups), or panned smoothly between two or more outputs.

**Channel Status**

12 The illuminated PFL switch feeds the pre-fade signal to the phones or control room, replacing the selected monitor source.

13 The illuminated ON switch activates the signal to the pre- and post-fade auxiliaries, routing and direct output.

14 The FADE is a 100mm Alps type with 10dB gain at maximum, and controls the level to the routing, post-fade auxiliaries and direct output.

15 The MUTING SYSTEM allows the channel status to be controlled by four master mute busses, originating in the master module. Mute selection is made by four individual switches (M1-M4) and the channel is muted whenever the corresponding mute master is pressed on the master module. The mute system has no effect when all switches are released.

Alternatively, the mute switches may be pre-selected and the channel isolated from the mute system by pressing SAFE. Mute action is enabled when required by releasing the SAFE switch.

**Metering**

16 The PEAK LED illuminates when the signal level exceeds +14dBu (6dB before clipping) at the output of the input amplifier, the output of the EQ, the insert return or the output of the fader amplifier.

17 The 8 segment meter displays the signal level in the module. The meter '0' mark corresponds to the nominal internal operating level of -2dBu. The source for the meter is factory set as post-EQ, post-insert but may be alternatively set, by changing internal jumpers, to the output of the input amplifier or post-fade.

The INSERT POINT is link selectable to be either pre- or post-EQ. The factory fitted default is post-EQ. Both the send and the return are unbalanced and at a level of -2dBu.

A DIRECT OUTPUT is provided. It is ground compensated at a level of -2dBu. See paragraph 8 on the previous page for a description of the sourcing and level control of the direct output.

The Microphone and Line inputs have provision for optional EDAC multicore interfacing. The signal from the Mic multicore connects in parallel with the XLR. The signal from the Line multicore enters the module via the break contacts of the line input jack.

The rear connector panel is integral to the module and houses all external interface connectors as shown on the left.
Specification

MICROPHONE INPUT

Electronically Balanced, (Transformer Optional)
Input Impedance >2kΩ
Maximum I/P Level +18dBu
Sensitivity Range -2 to -70dBu
CMRR >80dB at Max Gain, 1kHz
EIN 150Ω Source <−127.5dBu at max gain

LINE INPUT

Electronically balanced
Input Impedance >10kΩ
Maximum I/P Level +27dBu
Sensitivity Range -20 to +10dBu
CMRR >40dB at 1kHz
EIN 40Ω Source <−90dBu at unity gain

EQUALISER

Boost/Cut Range +/-15dB
Break Frequencies HF 12kHz Shelving, 2nd Order
HI MID 0.6 - 10kHz Peaking, Q=1.5
LO Mid 0.15 - 2.5kHz Peaking, Q=1.5
LF 60Hz 2nd Order Shelf
with 30Hz VLJ Rolloff
Highpass Filter -3dB at 100Hz, 2nd Order

GENERAL

Insert Send Level -2dBu, Unbalanced
Insert Send Max O/P +21dBu into 2kΩ
Direct Output Level -2dBu, Ground compensated
Direct Output Max O/P +21dBu into 600Ω
Mute Off Ratio >100dB @ 1kHz, 95dB @ 10kHz
Fader Off Ratio >80dB @ 1kHz, 80dB @ 10kHz
Reference 0dB
Panpot Cross talk <−85dB @ 1kHz, 80dB @ 10kHz
THD <0.005% @ 1kHz
<0.015% @ 10kHz
Mono Input Module

Description

Specifications

and Operation
Mono Input Module

**Channel Input**

1. +48V switch applies 48V phantom power to the microphone input.

3. LINE selects the line input to the channel.

4. ø (PHASE) reverses the phase of the selected input.

5. HI-PASS FILTER activates a 100Hz second order filter immediately after the input amplifier.

**Frequency Response Curves of the Hi-Pass Filter**

**Equaliser**

6. The EQUALISER is a 4-band semi-parametric. HF: +/- 15dB shelving at a fixed frequency of 12kHz. HI MID: +/- 15dB peaking, between 600Hz - 10kHz. Q = 1.5. LOW MID: +/- 15dB peaking, between 150Hz - 2.5kHz. Q = 1.5. LF: +/- 15dB shelving at a fixed frequency of 60Hz, with 30Hz LF rolloff. The cut/boost pots are centre detented, the centre position giving a flat response. EQ switches the equaliser into circuit.
Frequency Response Curves of the Equaliser

Auxiliaries

7 Six AUXILIARY SENDS are provided: Aux sends 1 through 4 have their sources individually selectable by internal jumpers. 1 & 2 can be: pre-EQ, pre-fade, or post-fade. 3 & 4 are either pre- or post-fade. The factory fitted default is AUX 1 and 2 pre-fade, AUX 3 and 4 post-fade. Aux sends 5 is permanently sourced post-fade. Aux 6 may be selected as pre-fade or post-fade by repositioning an internal jumper.

Direct Output

8 DIR determines the source of the direct output signal. With the switch in the up position the direct output is post-fade at a fixed level, and the Aux 6 control feeds Aux 6 bus. Pressing DIR causes the direct output to be fed from the Aux 6 control, and the Aux 6 bus is disconnected from the module. The source of the Aux 6 control (and hence the direct output when DIR is pressed) is jumper selectable to be pre- or post-fade. The direct output signal is ground compensated.
Routing

9 PAN determines the position of the signal within the stereo image. In the centre position (detented) there is a 4.5dB level drop. Pan left feeds the signal to odd numbered busses, pan right to even busses. Panning fully left or right sends signal to only the left or right side respectively.

13 Five ROUTING SWITCHES give access in pairs to MIX left and right busses and 8 group busses. The signal may be routed to an individual bus by using the relevant routing switches with the PAN control turned fully left or right.

Channel Status

10 The PEAK LED illuminates 7dB below clipping point, ie, it illuminates when a level of +14dBu is present within the module. It is sourced from the insert send.

11 The illuminated PFL switch feeds the pre-fade signal into the monitor system, where it replaces the selected monitor source.

12 The illuminated ON switch activates the signal to the pre- and post-fade auxiliaries, routing and direct output.

14 The FAADER is a 100mm Alps type, with 10dB gain.

15 The MUTING SYSTEM allows the channel status to be controlled by four master mute busses, originating in the master module. Mute selection is made by four individual switches. The mute system has no effect when all switches are released.

The INSERT POINT is link selectable to be either pre- or post-EQ. The factory fitted default is post-EQ. Both the send and the return are unbalanced and at a level of -2dBu.

A DIRECT OUTPUT is provided. It is ground compensated at a level of -2dBu. See paragraph 8 on the previous page for a description of the sourcing and level control of the direct output.

The Microphone and Line inputs have provision for optional EDAC multicore interfacing. The signal from the Mic multicore connect in parallel to the XLR. The signal from the Line multicore enters the module via the break contacts of the line input jack.

The rear connector panel is integral to the module and houses all external interface connectors as shown on the left.

INPUT METERING is provided on an optional overbridge, and the monitored signal is the output of the mic/line input amplifier.
Specification

Stereo Input Module

Description

Specifications

and Operation
Stereo Input Module

Channel Input
1 GAIN adjusts the sensitivity of the line inputs of both channels from -20dBu to +10dBu.
2 B selects the alternative B inputs which may be fitted with an RIAA preamp option.
3 Ø LEFT reverses the phase of the left channel of the selected input.
4 WIDTH is a continuously variable control which allows the width of the stereo image to be varied from mono (ACW) through stereo (centre detent) to phase enhanced wide stereo (CW).

Equaliser
5 The EQ section is 3-band semi-parametric. HF: +/- 15dB shelving at a fixed frequency of 12kHz. MID: +/- 15dB peaking between 0.3 - 3kHz. Q = 1.0 minimum. LF: +/- 15dB shelving at a fixed frequency of 60Hz. The cut/boost pots are centre detented, the centre position giving a flat response. EQ switches the equaliser into circuit.

Auxiliaries
6 Six AUXILIARY SENDS are provided: Auxiliary sends 1 and 2 are internally individually link selectable for pre or post fade, and mono or stereo operation: when stereo is selected, the left channel feeds AUX 1, and the right AUX 2. The factory default is AUX 1 and 2 pre fade, mono. AUX 3 through 6 are permanently sourced mono, with AUX 3 and 4 link selectable to be pre fade or post fade (default), whilst AUX 5 and 6 are permanently post fade.

Frequency Response Curves of the Equaliser
Routing

7. The BAL (balance) control determines the relative level of the L and R signals. In the centre position (detented) its gain is unity. Turning it fully CW increases the right signal by +4.5dB, and totally kills the left signal. Full ACW rotation has the opposite effect. Balance left biases the signal to odd numbered busses, balance right to even busses.

11. Five ROUTING SWITCHES give access in pairs to MIX left and right busses and 8 group busses.

Channel Status

8. The PEAK LED illuminates 7dB below clipping point, i.e., it illuminates when a level of +14dBu is present within the module. It is sourced from the post EQ signal.

9. The illuminated PFL switch feeds the pre-fade signal into the monitor system, where it replaces the selected monitor source.

10. The illuminated ON switch activates the signal to the pre- and post-fade auxiliaries and routing.

13. The MUTING SYSTEM allows the channel status to be controlled by four master mute busses, originating in the master module. Mute selection is made by four individual switches. The mute system has no effect on the channel when all switches are released.

12. The FADER is a stereo 100mm Alps type, with 10dB gain.

The inputs are electronically balanced. Transformer input balancing is not available on this module.

Line Input A has provision for optional EDAC multicore interfacing. The signal from the Line multicore parallels the input. When the line multicore option is not fitted, the break contacts are shorted together via a link.

The rear connector panel is integral to the module and houses the 4 external interface connectors as shown on the left.
Specification

LINE INPUTS

- Electronically Balanced
- Input Impedance: >10kΩ
- Maximum Input Level: +27dBu
- Sensitivity Range: -20 to +10dBu
- CMRR: >40dB @ 1kHz

EQUALISATION

- Boost/Cut Range: +/-15dB
- Break Frequencies:
  - HF 12kHz Shelving
  - MF 0.3 - 3kHz Peaking, Q=1
  - LF 60Hz Shelving

GENERAL

- Mute Off Ratio: >95dB @ 1kHz, 90dB @ 10kHz
- Fader Off Ratio: >80dB @ 1kHz, 80dB @ 10kHz

- L/R Crosstalk: <60dB @ 1kHz, 10kHz
- Width Control at Centre: <0.005% @ 1kHz
- THD: <0.02% @ 10kHz

Stereo input module
Dual Group/EQ Module

Description

Specifications

and Operation
Dual Group/EQ Module

This output module provides simple subgrouping facilities with a 3 band semi-parametric EQ on each group.

**Equaliser**

1 & 2 The EQ section is a three band design, giving shelving HF and LF controls with frequencies of 12kHz and 60Hz, together with a MID section that operates from 250Hz to 4kHz. The LP section also has 30Hz VLF rolloff.

Cut and boost on all sections is +/-15dB maximum.

The upper section controls the odd numbered group, and the lower section the even numbered group.

The EQ is put into the signal paths by the EQ switches.

**Frequency Response Curves of the Equaliser**

![Frequency Response Curves](image)

**Group output.**

The group busses are fed to single ended low noise virtual earth summing amplifiers via moveable 0.1" links to select the position of the particular module in the console. The summing amplifier outputs are at a nominal level of -2dBu, and feed the insert sends on the rear panel; the insert return feeds the EQ and then the group faders.

3 When the STE switch is activated, the group signals are fed to the stereo mix as a stereo pair, odd groups routing to left, even to right.

4 The buffered post fade signals can be routed individually in mono at unity gain to the stereo mix bus by the illuminated MIX switches.
5 The pre fade group signals are accessed by individual illuminated PFL switches.

6 The FADERS are 100mm Alps types, with unity gain (0dB) at the top of their travel.

7 The 20 segment LED bargraph METERS read the group outputs and are link selectable for a peak or average response.

The post fade group signals are electronically balanced and fed to the rear panel XLR connectors: the nominal level at these connectors is +4dBu.

The group outputs have provision for optional EDAC multicore interfacing.

The rear connector panel is integral to the module and houses the 4 external interface connectors as shown,
Specification

GROUP OUTPUT

Dual Group/Stereo Return Module

Description

Specifications

and Operation
Functionally this module comprises two separate parts: the dual group output and the stereo effects return.

Stereo return.

The Left and Right line inputs are accessed by 1/4" stereo jacks on the rear connector panel. These inputs are buffered by a standard line input stage, which has a nominal sensitivity of +4dBu, switchable by a rear panel switch to -10dBV. The switch has physical protection against accidental operation.

1. The WIDTH control allows continually variable control over the WIDTH of the stereo image from mono (ACW) through normal stereo (centre detent) to phase enhanced wide stereo (CW).

2. Individual summed mono sends to auxiliary busses 1 and 2 are provided through the rotary controls AUX 1 and AUX 2. These are shipped as pre-fade, but may be individually selectable by internal jumpers to be post fade.

3. The BALANCE control trims the level of the signal being fed to the routing switches. In the centre position the gain of the balance control is unity. Turning it fully CW increases the right signal by +4.5dB, and totally kills the left signal. Full ACW rotation has the opposite effect. Balance left biases the signal to odd numbered busses, balance right to even busses.

4. The illuminated PFL switch allows monitoring of a mono sum of the signal.

5. The illuminated ON switch enables the signal to be routed to all the outputs (Group busses and Mix) of the return.

6. The 60mm throw Alps FADER has a gain of +10dB at the top of its travel. It controls the level fed to the centre detented balance control which in turn feeds the routing switches. These give access to all group busses and the stereo mix bus.
**Group output.**

The group busses are fed to single ended low noise virtual earth summing amplifiers via 0.1" movable links to select the position of the particular module in the console. The summing amplifier outputs are at a nominal level of -2dBu, and feed the group faders via the insert. An internal switch selects the pair of inserts that the module feeds (1 & 2, 3 & 4).

**Routing**

8 & 9 The post fade signals can be routed individually as mono signals at unity gain to the stereo mix bus by the illuminated MIX switches. If the STE switch is depressed, the group signals are fed to the stereo mix as stereo signals, odd groups routing to left, even to right.

The post fade group signals are also buffered, electronically balanced and fed to the rear panel XLR connectors: the nominal level at these connectors is +4dBu.

10 The pre fade group signals are accessed by individual illuminated PFL switches.

11 The group FADERS are 100mm Alps types, with unity gain (0dB) at the top of their travel.

**Metering**

12 The 20 segment LED bargraph METERS normally read the group outputs and are link selectable for a peak or average response. Selecting the RET switch allows the stereo return signal to be metered.

The insert jacks are located in rear aperture panels.

The rear connector panel is integral to the module and houses the stereo return level switch and the 4 external interface connectors. The returns and group outputs have provision for optional EDAC multicore interfacing. The signals from the Line multicore parallel the return inputs.
Specification

**GROUP OUTPUT**
Electronically Balanced
Insert Send Nominal Level -2dBu
Nominal Output Level +4dBu
Maximum Output Level >+26dBu into 600Ω
Output Impedance 75Ω

Group - Group Crosstalk:
Same Module < -90dB @ 1kHz
< -85dB @ 10kHz
Adjacent Module < -105dB @ 1kHz
< -95dB @ 10kHz
Fader Off Ratio > 85dB @ 1kHz
> 80dB @ 10kHz
Mix Switch Off Ratio > -100dB @ 1kHz
> -95dB @ 10kHz
THD 0.003% @ 1kHz
0.005% @ 10kHz

**STEREO RETURN**
Electronically balanced
Input Impedance 10kΩ
Nominal Input Level +4dBu/-10dBV, Switchable
Mute Off Ratio > 95dB @ 1kHz
> 90dB @ 10kHz
Fader Off Ratio > 75dB @ 1kHz, 10kHz
Balance Pot Off Ratio > 70dB @ 1kHz, 10kHz
L/R Crosstalk,
Width Control at Centre < -60dB @ 1kHz, 10kHz
THD 0.003% @ 1kHz
0.007% @ 10kHz

Dual group/stereo return module
Dual Matrix Module

Description

Specifications

and Operation
Dual Matrix Module

**Module Input**

1 & 2 The module contains two functionally identical receive matrix sections designated A (upper) and B (lower). Each dual matrix output module allows the creation of two additional output mixes from the signals present at the group and mix outputs.

The MIX L and R signals enter the module via a 20 way ribbon cable that runs from the master rear conn via the masters to the group output modules. The group signals enter via a 10 way ribbon cable that connects to all group and matrix modules. All internal inputs are at a level of -2dBu, and all the matrix level controls have a gain of unity when fully clockwise. The matrix summing amplifiers have a gain of -6dB, which is made up after the fader, to optimise fader headroom.

The External Input is balanced. Its sensitivity is switchable between +4dBu and -10dBV. The switch is located on the rear panel and affects both external inputs. It has physical protection against accidental operation. Each input is summed into the matrix mix at fixed (unity re. the output) gain. The External inputs can be used for feeding sub-mixes directly into the matrix.

3 The left and right stereo mix signals are summed into the matrix mix via the MIX L and R level controls.

4 The eight GROUP LEVEL controls set the level of each group sent to the matrix mix.

5 The AFL switch allows each signal to be monitored.

6 The post fade signal is buffered and balanced before being output via the ON switch to the rear panel XLR sockets at a nominal level of +4dBu.

7 The output level of each matrix mix is controlled by a rotary FADEr, with a gain of 0dB when rotated fully CW.

The rear connector panel is integral to the module and houses the external interface connectors. The External Inputs have provision for optional EDAC multicore interfacing. The signal from the Line multicore can either parallel the external input or enter the module via the break contacts of the external input jack. When the line multicore option is not fitted, the break contacts are shorted together via a link.

Dual Matrix modules will normally be fitted on the far right-hand side of the frame.

Master Module

Description

Specifications

and Operation
Master Module

Auxiliaries

1 The AUXILIARY SEND MASTER level controls set the output level of the auxiliary send mixes; the output level can be conveniently monitored using the aux send AFL switches. Optimum noise performance will be obtained with the send controls on the input channels turned up far enough to give a peak output level (metered using the aux send AFL switch) of +16 with the output level control at unity gain (7 on the scale). The output level should then be turned down to suit the input level of the device the send is driving.

Master Outputs

2 INSERT points are provided in the stereo mix signal path to enable the insertion of external processing devices in the signal path.

3 The master output FADERS control the level of the stereo mix output. In order to preserve headroom, they should normally be run in the top 10dB of their range. If the stereo output is feeding a device which requires a lower input level (e.g. a domestic tape recorder), the reference level of the output and 2-track return level should be changed using the internal switch: see the Venue II technical manual.

A mono sum of the stereo mix signal, taken before the main faders, is available on the rear connector panel.

Monitoring

4 Provision is made to monitor the stereo mix output, the PFL signal and the 2 track return (see Ancillary Connector Panel). The CR MON jacks on this panel are available to drive on external power amplifier/ loudspeakers, alternatively stereo HEADPHONES can be plugged into the front panel jack: this will mute the CR MON outputs. The level is set by the MONITOR LEVEL control. Selection of the 2TRK switch routes the 2 track tape return inputs to the monitors. Selecting a PFL switch on any input will automatically switch the monitoring to the PFL signal, overriding the Mix/2 track selection.

Output Meters

5 The stereo output METERS automatically follow the monitor selection of mix/2 track/PFL, though the meter reading is independent of the MONITOR LEVEL. The meter reading is relative to the operating level selected (see 3 above).

Oscillator

6 A 1kHz OSCILLATOR is provided, which feeds a sine wave output of up to +16dBu to all groups, the stereo mix and aux busses, at a level set by the OSC LEVEL control. The oscillator is enabled by the ON switch, and is overridden by the selection of the talkback switch.
Talkback

7 Talkback can be routed to either aux send 1 and 2 (1-2 switch), or to all buses (ALL switch). An integral mic is provided, flush mounted behind the front panel, with an associated gain control TB GAIN. In order to avoid acoustic feedback, the CR monitor outputs are attenuated ("Dimmed") by approximately 20dB when talkback to Aux 1-2 is selected, and muted when talkback to ALL is selected.

8 The MUTING SYSTEM allows the input channel status to be controlled by four Master Mute busses. Operation of any of the master buttons mutes any input channels selected to the corresponding mute bus.

Insert points are provided in the stereo mix path to enable the insertion of external processing devices in the signal path.
Specification

**Auxiliary Send Outputs**

- Electronically Balanced
- Nominal Level: +4dBu
- Maximum Output Level: +27dBu into 600Ω
- Output Impedance: 75Ω
- Master Gain Control Range: +10dB...-85dB
- Aux-Aux crosstalk: <-80dB at 1kHz
- THD: 0.003% at 1kHz, 0.006% at 10kHz

**Mix L&R Outputs**

- Electronically Balanced
- Insert Send Nom. Level (Unbal): -2dBu
- Insert Send Maximum Output: +21dBu into 1kΩ
- Insert Return Impedance: 10kΩ
- Master Fader Rejection: >80dB at 1kHz
- Stereo Mix Output Nom. Level: +4dBu/-10dBV Selectable
- Stereo Mix Maximum Output: +27dBu into 600Ω
- Output Impedance: 75Ω
- L/R Crosstalk: <-80dB at 1kHz
- THD: 0.003% at 1kHz, 0.006% at 10kHz
- Mono Output Level (Unbal): +1dBu
- Mono Maximum Output Level: +21dBu into 600Ω

**Monitor Outputs and Switching**

- CR Mon Nominal Output Level: +4dBu
- Maximum Output Level: +20dBu into 5kΩ
- Output Impedance: <=75Ω
- Phones Nominal Output Level: +4dBu
- Phones Output Maximum Level: +20dBu into 600Ω, +14dBu into 50Ω, 0dBu into 8Ω
- 2-Track Return Nominal Level: +4dBu/-10dBV Switchable
- 2-Track Return Maximum Level: +25dBu
- 2-Track Return to Mix Crosstalk: <-85dB at 1kHz

  - Selectable, Peak or Average Reading
  - Calibration Range: '0'dB = -2dBu to +20dBu
  - Accuracy Relative to '0'dB: +/-1dB
VU Overbridge Option
VU Overbridge Option

The Venue Theatre VU overbridge provides metering of the groups and mix/PFL signal, providing higher resolution around the 0VU point than the internal LED bar-graph meters.

The meters are factory calibrated for 0VU = +4dBu at 1kHz. Each meter has an integral peak LED, which illuminates when the level at the group or mix output exceeds +14.5dBu. The LED indicator has a fast attack/slow decay characteristic to give a clear indication even of short peaks.

To allow easy viewing of the meters under low-light conditions, the meter scales are back-lit by bulbs inside the overbridge.

The overbridge may be removed from the console for transport, and is detachable from the console frame. This requires the removal of a few bolts, and the disconnection of a D-type connector.

When fitting the VU overbridge the internal console overbridge wiring must be installed - instructions and wiring are provided with the overbridge.
**SPECIFICATION NOTES AND CONDITIONS**

A The figures displayed in the Specification tables are for a 32 input channel console: other frame sizes may show different results.

B The console has a nominal output level of +4dBu: all input sensitivities are relative to this: i.e. with line input gain set to '0', an input of 0dBu, will give an output of +4dBu at any group or mix output and, a sensitivity of +4dBu gives unity gain from input to output.

C Noise measurements are taken with 22Hz-22kHz bandwidth, average reading response.

D Distortion measurements are made with an input of +20dBu (line inputs at +4dBu sensitivity) giving an output of +20dBu. The analyser reads THD+N with an average response, over a 30kHz bandwidth.

E Frequency response and E.Q. measurements are made with an input of 0dBu to line inputs at unity gain, outputs are quoted relative to 0dBu.

F Crosstalk and rejection measurements are made with an input level of +20dBu (line inputs at +4dBu sensitivity) giving an output of +20dBu on the active signal path. The ratio quoted is relative to +20dBu output.

G Gain tolerance +/- 1.5dB or 10% of indicated value, whichever is the greater.

H All crosstalk and rejection figures stated with 16 channels routed to the measured output, where applicable.

I Mix noise figures are stated in three ways:
   - Bus residual noise: Noise measured at the output with no inputs routed.
   - Mix bus noise: Noise measured at the output with 16 channels routed, faders down.
   - Typical mix noise: Noise measured at the output with 16 channels routed, faders at 0, line inputs at +4dBu sensitivity, terminated 40Ω.

1.1 **Soundcraft** means Soundcraft Electronics Ltd.

1.2 **Owner** means the purchaser of the Equipment from Soundcraft or its dealer, who is the legal and beneficial owner at the time the Warranty claim is made.

1.3 **Dealer** means the person other than Soundcraft (if any) from whom the Owner purchased the Equipment, provided such a person is authorised for this purpose by Soundcraft.

1.4 **Equipment** means the equipment sold with this warranty card.

2 If within the period of twelve months from the date of delivery of the Equipment to the Owner, it shall prove defective by reason only of faulty materials and/or workmanship to such an extent that the suitability for the purpose for which it has been designed is materially affected, the Equipment or, with the consent of Soundcraft or the Dealer, the defective component should be returned to the Dealer or to Soundcraft and subject to the following conditions the Dealer or Soundcraft will repair or replace any defective component. Any Equipment or component replaced will become the property of Soundcraft.

3 Any Equipment or component returned will be at the risk of the Owner whilst in transit (both to and from the Dealer or Soundcraft) and postage and/or delivery charges must be prepaid.

4 This warranty shall only be available if:

   a) the Warranty Card has been returned to Soundcraft within thirty days of purchase of the Equipment by the Owner; and

   b) the Equipment has been properly installed in accordance with instructions contained in Soundcraft’s manual; and

   c) the Owner has notified Soundcraft or the Dealer within fourteen days of the defect appearing; and

   d) no persons other than authorised representatives of Soundcraft or the Dealer have effected any replacement of parts or carried out maintenance, adjustments or repairs to the Equipment; and

   e) the Owner has used the Equipment only for such purposes as Soundcraft recommends, with only such electrical and operating supplies as meet Soundcraft’s specifications and otherwise in all respects in accordance Soundcraft’s recommendations.

5. Defects arising as a result of the following are not covered by this Warranty: mishandling, chemical, electro-chemical, electro-magnetic or electrical influences, accidental damage, Acts of God, neglect, deficiency excess or surges in electrical power, air-conditioning or humidity.

6. The benefit of this Warranty may not be assigned by the Owner.

7. Owners who are consumers should note that their rights under this Warranty are in addition to and do not affect any other rights to which they may be entitled against the seller of the Equipment.
